LIGHT RAIL
About Rollon

Continual expansion and optimization of the portfolio

Founded in 1975, Rollon manufactured high-precision linear roller bearings for the machine tool industry. Early on, Rollon started manufacturing linear bearings based on the bearing-cage design. In 1979, the Compact Rail self-aligning linear bearings joined the Telescopic Rail industrial drawer slides and Easy Rail linear bearings and became the basis of the strong foundation on which the company is building upon today. Continuing optimization of these core products still remains one of the most important goals at Rollon. The development of the patented Compact Rail linear bearing, which uses different proprietary rail profiles and high-precision radial ball bearing sliders, enables the compensation of height and angle mounting defects in applications, and is only one example of the continuing efforts to innovative the development of our existing product families. In the same manner, we continually introduce innovative new product families displaying our continuing product development and optimization in the industry. These include:

■ 1994 Light Rail - full and partial extension telescopic in lightweight design
■ 1996 Uniline - belt driven linear actuators
■ 2001 Ecoline - economical aluminum linear actuators
■ 2002 X-Rail - inexpensive formed steel linear guides
■ 2004 Curviline - curved monorail profile rail guide with roller carriages
■ 2007 Monorail - miniature sizes and full sized

Each further innovation of our linear bearings is built upon the our extensive knowledge of the nine product families in production today as well as on the current market demands. Rollon is the ultimate linear technology for any application needs.

Product explanation

Light Rail: Full and partial extensions in lightweight design

The Light Rail product family consists of five series with full and partial extensions in lightweight design. It is ideal for applications in which the mass of the rail is just as important as the bending rigidity.

The most important characteristics:
- Light and quiet running with heavy loads
- Long service life without maintenance
- Effective self-cleaning of the ball track
- High functional reliability
- Structural elasticity capable of absorbing minor impacts and absence of permanent deformation
- Not sensitive to side impacts

Preferred areas of application:
- Beverage industry
- Automotive
- Construction and machine technology (e.g., housing)
- Packaging machines
- Railcars (e.g., maintenance and battery extensions)
- Special machines
LPS 38
Partial extension with rails made of hot-dipped galvanized steel and plastic ball cages.

LFS 46
Detachable internal rail which can be released with a latch. Rails are made of bright chrome-plated steel, the ball cages of steel and plastic. Roll back protection in closed position.

LFS 57
Full extension with rails made of hot-dipped galvanized steel and zinc-plated steel ball cages. Roll back protection in closed position.

LFS 58 SC
Full extension with automatic retraction and damping. The automatic retraction system is assisted by a spring-loaded mechanism that allows the rail to get back to a complete retraction before reaching the closed position.

LFS 70
Full extension with rails made of zinc-plated galvanized and blue passivated steel. The ball cages are made of zinc-plated steel. Heavy load end stop in opened and closed position. Roll back protection in closed position.
Technical data

**Performance characteristics:**
- Extension speed (depending on application):
  - Extension distance 100 - 500 mm: max. 0.5 m/s (19.69 in/s)
  - Extension distance 600 mm: max. 0.4 m/s (15.75 in/s)
  - Extension distance 700 mm: max. 0.3 m/s (11.81 in/s)
- LFS 58 SC series with automatic retraction
- Temperature range: +10 °C to +40 °C (+50 °F to +104 °F)
  - Temporary storage and transport temperature: -20 °C to max. +80 °C (-4 °F to +176 °F)
- All systems are lubricated for life
- Rail material: hot-dipped galvanized steel or chromated steel
- Ball cage material: zinc-plated steel or plastic
- Ball material: hardened carbon steel

**Remarks:**
- Assembly in cross-sectional width, here a positive tolerance of +0.5 mm is recommended (mounted under tension). If the extensions are installed with too small a tolerance, the service life is decreased
- Load capacity is per single rail (not per pair)
- Cycle data applies to the use of an extension pair (recommended)
- Vertical use of extensions (radial load) is recommended
- The load capacity is reduced with horizontal installation (see pg. 12)
- Cathodic edge protection, additional corrosion protection with powder coating on request
- Roll back protection in closed position is friction locked (except LPS 38)
- Not suitable for moments – must be used as extension pair

Tab. 5
Technical instructions

Load capacities

**Vertical installation**

The given loading capacities are guidelines for an extension rail vertically mounted with uniform load distribution using all mounting holes. The load values must be reduced in unfavorable conditions.

**Horizontal installation**

For horizontal mounted extensions the load capacity is reduced by approx. 50 - 60%.
**Speed**

The extension speed is determined by the size of the intermediate elements. Therefore, the maximum extension speed is inversely proportional to the overall extension of the rails (see fig. 15). The maximum extension speed is also directly related to the applied load and operating time. The indicated data refers to continuous operation at the maximum load capacity.

**Temperature**

Continual operating temperature of the Light Rail extensions is +10 °C to +40 °C. Temporary storage and transport temperature: -20 °C to max. +80 °C.

For more information please contact the Rollon Application engineering department.

**Lubrication**

All extensions of the Light Rail product family are lubricated for life.

Different lubricants for special applications are available upon request.

Example: Lubricant with FDA approval for use in the food industry.

For more information please contact the Rollon Application engineering department.

**Corrosion protection**

Base material for the Light Rail product family is cold-rolled, hot-dipped galvanized steel. The cathodic edge protection offers a perfect combination of quality and cost-efficiency. The surface protection conforms to RoHS.

For more information please contact the Rollon Application engineering department.

![Fig. 15](image-url)
Installation instructions

- The existing internal stops are not designed to stop the moving load. They are only supposed to retain the ball-cage and prevent the internal parts to slide out of the assembly. An external end-stop must always be installed to stop the moving load.
- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the Light Rail extensions with all accessible holes on a rigid and level surface. When using an extension pair, please observe the parallelism of the installation surfaces. The fixed and movable rails fit to the rigid assembly construction.
- Light Rail full and partial extensions are suitable for use in automatic systems. For this, the stroke should remain constant in all moving cycles and the extension speed must be checked (see pg. 13, fig. 15). The movement of the extensions is enabled by internal ball cages, which could experience an offset from the original position with differing strokes. This phase offset can have a negative effect on the running properties or limit the stroke. If differing strokes occur in an application, the drive force must be sufficiently dimensioned in order to appropriately synchronize the ball cage offset. As an alternative, an extra full stroke cycle can be performed every certain number of cycles, in order to re-phase the ball cage in its correct position.

Horizontally installed guides

Horizontally installed extensions can support tension or compression loads (see figs. 16 and 17).

For the horizontal mounting of extensions with compression loads, please keep the following conditions into account: The Hertzian stress of the balls in no longer effective due to the expansion of the rail profile; the nominal tension tolerance of +0.5 mm is eliminated due to the installation configuration. Both the above mentioned conditions contribute to a significant reduction of the axial load capacity.

Horizontally-mounted rails (axial load) also determine a considerably higher deflection of the extended tips if compared to traditionally vertically-mounted rails (radial load).
Portfolio

COMPACT RAIL
Rugged roller sliders with innovative self adjustment

UNILINE
Steel-reinforced, belt-driven linear actuators with hardened steel linear bearings and precision radial ball bearing rollers

CURVILINE
Curvilinear rails for constant and variable radii

MINIATURE MONO RAIL
Miniature format profile guideways with unique ball design

EASY RAIL
Compact, versatile linear bearings

TELESCOPIC RAIL
Smooth-running telescopic linear bearing drawer slides with low deflection under heavy loads

MONO RAIL
Profile guideways for highest degrees of precision

X-RAIL
Roller embossed stainless steel profiles for the use in rough environments
